

POWER BI PROJECT

SALES DATA ANALYSIS AND TRANSFORMATION USING POWER BI

BRIEF EXPLANATION:

This project focuses on cleaning, transforming and analyzing sales data using power BI. Three CSV files (List of orders, Order details, and Sales target) were imported into Power BI Power Query. Data cleaning techniques such as restricting records, changing data types, formatting duplicates, and merging tables were performed. Relationships were established between datasets to create an efficient data model. Finally, an interactive dashboard was developed to visualize key business metrics such as total sales, total profit, sales by state, sales by category, and sales trends over time. The dashboard helps users gain insights into sales performance and supports better business decisions making.

OBJECTIVES:

- Import and clean raw sales data
- Perform data transformation using power query
- Create relationships between datasets
- Analyze sales and profit performance
- Build an interactive Power BI dashboard for reporting and decision making.
